Functional Description

The CY62167EV30 is a high performance CMOS static RAM organized as 1M words by 16 bits or 2M words by 8 bits. This device features an advanced circuit design that provides an ultra low active current. Ultra low active current is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power down feature that reduces power consumption by 99 percent when addresses are not toggling. Place the device into standby mode when deselected ($\overline{CE}_1$ HIGH or CE_2 LOW or both $\overline{BHE}$ and $\overline{BLE}$ are HIGH). The input and output pins (I/O$_0$ through I/O$_{15}$) are placed in a high impedance state when: the device is deselected ($\overline{CE}_1$ HIGH or CE_2 LOW), outputs are disabled ($\overline{OE}$ HIGH), both Byte High Enable and Byte Low Enable are disabled ($\overline{BHE}$, $\overline{BLE}$ HIGH), or a write operation is in progress ($\overline{CE}_1$ LOW, CE_2 HIGH and $\overline{WE}$ LOW).

To write to the device, take Chip Enables ($\overline{CE}_1$ LOW and CE_2 HIGH) and Write Enable ($\overline{WE}$) input LOW. If Byte Low Enable ($\overline{BLE}$) is LOW, then data from I/O pins (I/O$_0$ through I/O$_7$) is written into the location specified on the address pins (A$_0$ through A$_{19}$). If Byte High Enable ($\overline{BHE}$) is LOW, then data from the I/O pins (I/O$_8$ through I/O$_{15}$) is written into the location specified on the address pins (A$_0$ through A$_{19}$).

To read from the device, take Chip Enables ($\overline{CE}_1$ LOW and CE_2 HIGH) and Output Enable ($\overline{OE}$) LOW while forcing the Write Enable ($\overline{WE}$) HIGH. If Byte Low Enable ($\overline{BLE}$) is LOW, then data from the memory location specified by the address pins appears on I/O$_0$ to I/O$_7$. If Byte High Enable ($\overline{BHE}$) is LOW, then data from memory appears on I/O$_8$ to I/O$_{15}$. See the "Truth Table" on page 9 for a complete description of read and write modes.

For best practice recommendations, refer to the Cypress application note AN1064, SRAM System Guidelines.

Notes
1. The information related to 6 x 7 x 1 mm VFBGA package is preliminary.
2. Ball H6 for the VFBGA package can be used to upgrade to a 32M density.
3. NC pins are not connected on the die.
4. The $\overline{BYTE}$ pin in the 48-TSOPI package has to be tied to V_{CC} to use the device as a 1M X 16 SRAM. The 48-TSOPI package can also be used as a 2M X 8 SRAM by tying the BYTE signal to V_{SS}. In the 2M x 8 configuration, Pin 45 is A20, while BHE, BLE and IO_8 to IO_{14} pins are not used.
5. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at $V_{CC} = V_{CC}$(typ), $T_A = 25°C$.

Capacitance

Tested initially and after any design or process changes that may affect these parameters.

Parameter	Description	Test Conditions	Max	Unit
C_{IN}	Input Capacitance	T_A = 25°C, f = 1 MHz, V_{CC} = $V_{CC(typ)}$	10	pF
C_{OUT}	Output Capacitance		10	pF

Notes
6. V_{IL}(min) = –2.0V for pulse durations less than 20 ns.
7. V_{IH}(max) = V_{CC} + 0.75V for pulse durations less than 20 ns.
8. Full Device AC operation assumes a 100 μs ramp time from 0 to V_{CC} (min) and 200 μs wait time after V_{CC} stabilization.
9. Under DC conditions the device meets a V_{IL} of 0.8V. However, in dynamic conditions Input LOW Voltage applied to the device must not be higher than 0.7V. This is applicable to TSOP I package only.
10. Only chip enables ($\overline{CE}_1$ and CE_2), byte enables ($\overline{BHE}$ and $\overline{BLE}$) and $\overline{BYTE}$ must be tied to CMOS levels to meet the I_{SB2} / I_{CCDR} spec. Other inputs can be left floating

Notes
14. Test conditions for all parameters other than tri-state parameters assume signal transition time of 1 V/ns, timing reference levels of V_{CC}(typ)/2, input pulse levels of 0 to V_{CC}(typ), and output loading of the specified I_{OL}/I_{OH} as shown in "AC Test Loads and Waveforms" on page 4.
15. AC timing parameters are subject to byte enable signals ($\overline{BHE}$ or $\overline{BLE}$) not switching when chip is disabled. See application note AN13842 for further clarification.
16. At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE}, t_{HZBE} is less than t_{LZBE}, t_{HZOE} is less than t_{LZOE}, and t_{HZWE} is less than t_{LZWE} for any device.
17. t_{HZOE}, t_{HZCE}, t_{HZBE}, and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
18. The internal write time of the memory is defined by the overlap of $\overline{WE}$, $\overline{CE}_1$ = V_{IL}, $\overline{BHE}$ or $\overline{BLE}$ or both = V_{IL}, and CE_2 = V_{IH}. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must refer to the edge of the signal that terminates the write.
